

SPRING LAKE PARK Neighborhood Meeting  
September 2016

The Clean Solutions for Omaha (CSO) project in Spring Lake Park began construction in May 2014. Now, nearly complete, Spring Lake Pond is a beautiful amenity that has both a purpose for the improvement of water quality and brings recreation to the community.

The Spring Lake Park pond has been restored and is serving as a stormwater detention feature with a water amenity which provides recreation, trails, and soon fishing to the long-time, mature park. Now, natural springs again fill the lake. The green infrastructure features, plus native grass, wildflower, and tree plantings provide food and habitat for wildlife and birds. Incorporating a detention feature with the restoration of the pond reduced the cost of this CSO Project by an estimated five million dollars.

In addition, the Missouri Avenue Phase 2 project is underway. This project will provide sewer separation at the golf course and in some residential areas near the park. There are two drawings on the reverse side to demonstrate the work that is being done.

The CSO! Project is supported by the Nebraska Environmental Trust, City of Omaha, and Omaha Parks, Recreation and Public Property. Plus, area neighborhoods, the Spring Lake Park team and the community have also been actively engaged in the success of the project.
